

SMARTLEAF CROP HEALTH REPORT

Crop: Tomato

Disease: Tomato Late Blight

Confidence: 99.29%

Severity: Severe

Recommended Treatment

Chemical: Apply fungicides such as chlorothalonil, mancozeb, or metalaxyl-based products to control the disease. Spray at 5 to 7 day intervals during cool and humid conditions. Begin applications at early signs of infection and ensure thorough coverage of leaves and stems.

Organic: Use copper-based fungicides approved for organic farming. Neem oil can help slow disease spread in early stages. Biofungicides containing *Bacillus subtilis* or *Trichoderma* may also provide some control when applied regularly.

Prevention: Use certified disease-free seeds or resistant varieties. Avoid overhead irrigation and ensure good drainage. Maintain proper plant spacing for airflow. Remove and destroy infected plants immediately to prevent spread. Practice crop rotation and avoid planting tomatoes or potatoes in the same area for 2 to 3 years. Avoid working with plants when they are wet.
